True North Continuity

Internal Business Development Brief

Internal · Confidential

PRODUCT OVERVIEW

Distributed, Intrusion-Safe Healthcare Archive

1. Ransomware resilience — a secondary EMR reconstructed from the live ADT stream. When the primary goes down, clinical operations continue in minutes, not days.

2. Exfiltration protection — Shamir key-splitting across independent nodes. A breached node yields ciphertext and one key share. Neither is useful alone.

INTERNAL MESSAGING

Four Pillars

“Recovery is solved. Exfiltration is not.”

Every competitor protects against deletion. No one protects against theft.

“Our downtime costs nothing.”

Secondary system. Shut down on suspicion. Zero clinical impact.

“Your doctors shouldn’t notice.”

Clinical continuity, not IT recovery. Minutes, not days.

“Trust you can see.”

Live verification display. Not a dashboard — a productization of trust.

COMPETITION

The Exfiltration Gap

VENDOR	IMMUTABLE	AIR-GAPPED	EXFIL-SAFE	AD-INDEPENDENT	CLINICAL VIEW
Commvault	✓	✓	—	—	—

Zerto	✓	—	—	—	—
Epic CRO	—	—	—	—	Partial
True North	✓	✓	✓	✓	✓

> *"The exfiltration column is the gap we fill."*

TARGET ACCOUNT

The First Conversations

We have a warm, friendly contact — a CMIO at a major 30-hospital, $6B+ health system who lived through a catastrophic ransomware attack in November 2023. Epic went dark across six states. Weeks on paper charts.

A second contact — a CIO at a single hospital within a wider hospital system — experienced a similar attack in early 2025. These are just our immediate, relatively small circles.

> *"If you'd had our network last November, your doctors wouldn't have noticed the Epic outage."*

SALES MOTION

Who Hears What

STAKEHOLDER	LEAD MESSAGE	SECONDARY MESSAGE
CIO	"Exfiltration protection your backup can't provide"	Reduced storage costs, HIPAA Safe Harbor positioning
CMIO	"Your doctors won't go back to paper charts"	Clinical continuity in minutes, verification display
CISO	"AD-independent security perimeter"	Key-splitting, mTLS authentication, zero-trust architecture
Compliance/Legal	"Recognized security practices under HIPAA"	HR 7898 Safe Harbor, audit-logged verification

OBJECTIONS

Product & Architecture Questions

“This is just another backup solution.”

No. Backup protects against loss. We protect against theft. Immutable backups stop deletion — they don’t stop exfiltration. The stolen data is still readable.

“What if YOUR system goes down?”

Nothing. We’re secondary. Zero clinical impact. The hospital continues on its primary EMR. Our downtime costs nothing.

“SSS isn’t built yet.”

Correct. The math is proven — Shamir’s Secret Sharing dates to 1979. We need a funded pilot to move from design to production.

OBJECTIONS

Compliance & Claims Questions

“Are you claiming HIPAA safe harbor automatically?”

No. HR 7898 recognizes “recognized security practices” as a mitigating factor. We reduce exposure. We don't claim exemption.

“Why not Epic CRO or EMRrescue?”

They restore access. They don’t prevent theft. Once backup data is exfiltrated, those solutions have no answer. We do.

GTM CHALLENGE

Selling Without Admitting Vulnerability

Reframe as resilience — “How quickly can you resume clinical operations?” not “Have you been breached?”

Compliance-driven entry — HIPAA Safe Harbor as the door-opener, not ransomware fear

Doubting Thomas pitch — “Let us show you what we can see” — the verification display converts skeptics

Insurance as channel — Cyber insurers want policyholders to have exfiltration protection

Peer networks — HIMSS, CHIME, regional health IT groups — word of mouth from clinicians who lived it

SECONDARY OPENER

“High Compliance Doesn’t Have to Mean Hard and Slow”

For prospects not ready for the ransomware conversation. The archive nodes are easy to add or remove. Policy-driven replication. Can stand up on customer infrastructure.

Data portability as the entry point — ransomware resilience as the deeper value once trust is established.

GUARDRAILS

What to Say and What Not to Say

"We protect against theft, not just loss"	"We're unhackable" or "breach-proof"
"Secondary system — our downtime costs nothing"	"You don't need backups anymore"
"Reduced exposure, not exemption"	"Guaranteed HIPAA safe harbor"
"The math is proven. We need a funded pilot."	"SSS is already in production"

BEYOND HEALTHCARE

Expansion Opportunities

Insurance (channel, not customer) — Cyber insurers as distribution partners. They want policyholders protected.

Legal — Entrenched incumbents (iManage, NetDocuments). Long sales cycles. Not near-term.

Finance — Heavy regulation but different threat model. Not a priority.

Government — FedRAMP certification cycles. 12–18 month runway before viable.

SUMMARY

Four Pillars, One Gap

Recovery is solved. Exfiltration is not. Our downtime costs nothing. Your doctors shouldn't notice. Trust you can see.
