True North Systems

Your Doctors Shouldn’t Have to Notice When Epic Goes Down

True North Continuity — Clinical Continuity Brief

RECENT HISTORY

When Epic Goes Dark

November 2023. A 30-hospital health system. Epic went dark across six states. Ambulances diverted. Surgeries cancelled. Weeks on paper charts.

RECENT HISTORY

It Happened Again

Change Healthcare, February 2024. One in three patient records offline. 94% of hospitals impacted. Some disruptions lasted months.

> *The standard response — restore from backup — takes days to weeks. Your clinicians are flying blind.*

THE PROMISE

> The difference is between “we can recover in days” and “we can keep caring in minutes.”

DURING AN OUTAGE

Two Realities

WITHOUT CONTINUITY	WITH TRUE NORTH CONTINUITY
✕ Paper charts	✓ Secondary EMR
✕ No patient histories	✓ Live patient census
✕ Manual bed tracking	✓ Verified records
✕ Ad-hoc workflows	✓ Staffing continuity

The difference between flying blind and keeping care continuous

HOW IT WORKS

A Secondary EMR That's Always Current

Continuous admissions, discharges, and transfers capture. When the primary goes down, the archive reconstructs a current clinical view. Not last night's backup.

Not last night's backup — the current clinical view

DATA SAFETY

Patient Records That Can’t Be Stolen

Every record is encrypted. The decryption key is split across multiple servers in independent locations. No single server holds enough to read a record.

> *Even if an attacker gets full access to one server, they cannot read a single record — the key isn’t there.*

IN YOUR OFFICE

A Window Into Your Hospital's Data

Records streaming, click to verify, authentication, reconstruction, audit-logged. A personal clinical tool — always running, always verifiable.

PILOT

Getting Started

Alongside your existing systems. Feed connection, data flowing in days. Single facility or service line. Scheduled downtime drills to build clinical confidence.

Status: The relay network is built. The verification interface is what we'd validate together in a pilot.

“

Your doctors should never have to go back to paper charts because of a cyber attack. The data should always be there, always verifiable, and always safe.
